IPFW is a stateful firewall written for FreeBSD which supports both IPv4 and IPv6. It is comprised of several components: the kernel firewall filter rule processor and its integrated packet accounting facility, the logging facility, NAT, the dummynet (4) traffic shaper, a forward facility, a bridge facility, and an ipstealth facility.

### **30.4. IPFW - FreeBSD**

ipfw can be used to make manual, single rule additions or deletions to the active firewall while it is running. The problem with using this method is that all the changes are lost when the system reboots. It is recommended to instead write all the rules in a file and to use that file to load the rules at boot time and to replace the currently running firewall rules whenever that file

changes.

## **29.6. IPFW - FreeBSD.org personal home pages**

IPFW is included in the basic FreeBSD install as a kernel loadable module, meaning that a custom kernel is not needed in order to enable IPFW.. For those users who wish to statically compile IPFW support into a custom kernel, refer to the instructions in Chapter 8, Configuring the FreeBSD Kernel. The following options are available for the custom kernel configuration file:
