My dad was an electrical engineer by trade with a lot of experience in aircraft radio design. After a series of Digifant problems he decided that the VW grounding system was not good enough so he added a #8 wire from the battery to the engine bay with stops at all the stock ground locations. Since then, no ground-related issues.

To ensure proper ground path (across the five or six 35-year old magnesium transaxle case 'connections') is not contributing to starter problems, it's advisable to replace it with a new cable coming directly from the starter bolt to the chassis. A new cable is a small price to pay to remove the ground path from frustrating phantom starter gremlins.

If you have a fiberglass body you will need to attach several heavy ground wires to the engine block. Run one to the rear, two to the dash area (if you have a lot of accessories), and one to the front. Each individual ground can be routed to a central location and all of the components in that general area can be grounded to it.
