Equilibrium Physics Problems and Solutions - DSoftSchools

If an object is at equilibrium, then the forces are balanced. Balanced is the key word that is used to describe equilibrium situations. Thus, the net force is zero and the acceleration is 0 m/s/s . Objects at equilibrium must have an acceleration

of 0 m/s/s . This extends from Newton's first law of motion. But having an acceleration of 0 m/s/s does not mean the object is at rest.

Solution: Note that all the forces come together at the knot in the rope so draw a force diagram about this point. The only laws to apply are for equilibrium in the x and y directions. This provides two equations in two unknowns. Because $\sin 45^\circ = \cos 45^\circ$ rewrite . and . As an exercise work through this problem with different angles.

All examples in this chapter are planar problems. Accordingly, we use equilibrium conditions in the component form of Equation 12.7 to Equation 12.9. We introduced a problem-solving strategy in Example 12.1 to illustrate the physical meaning of the equilibrium conditions. Now we generalize this strategy in a list of steps to follow when
